

# KUNYANG (KYRIE) XIE

+1(226) 581-2915 ✧ Waterloo, ON

[k47xie@uwaterloo.ca](mailto:k47xie@uwaterloo.ca) ✧ [kyxie.github.io](https://kyxie.github.io)

## EDUCATION

---

**University of Waterloo**, Waterloo, Ontario, Canada Sep. 2021 - Dec. 2022  
MEng in Software Engineering

**Univ. of Electronic Sci. and Tech. of China**, Chengdu, Sichuan, China Sep. 2017 - Jun. 2021  
BEng in EE, GPA: 3.8/4, 88/100

**University of Glasgow** Sep. 2017 - Jun. 2021  
BEng in EEE with First Class Honors, GPA: 19.2/22

## SKILLS

---

**Languages** Java, Python, JavaScript, C/C++, MATLAB, Verilog  
**Frameworks** Node.js, Express, MongoDB, Mocha, PyTorch

## PROJECTS

---

**Turbo Wallet - Money Management App**, *JavaScript, Express, MongoDB, Mocha* [GitHub](#)

- A money management app helps us to track household expenses and incomes.
- The front-end is based on React.js while the back-end uses Express.js framework and interacts with database of MongoDB.
- We can add, edit and delete the expense and income records, and the app creates a series of charts based on recent records to help analyze economic conditions.
- We can also visually see which kinds of purchases cost how much and the order of different kinds of purchases.

**Security Cameras Installation System**, *Python, C++, CNF-SAT* [GitHub](#)

- This project helps the local police department with their installation of security cameras at traffic intersections. We solved a particular kind of optimization problem, called the Vertex Cover problem.
- We use Python to generate a map contains the details about a city's traffic (the roads and intersections), then try to find the shortest path using the Dijkstra algorithm in the city, and finally, we solve the Vortex Cover problem using CNF-SAT to simulate the whether the installation of cameras can cover all the city streets.
- This project implements multi-threading and parallel processing to run more efficiently.

**Pedestrian Re-Identification based on Deep Learning Methods**, *PyTorch* [GitHub](#)

- This project is a pedestrian re-identification project based on deep learning methods. The frameworks is PyTorch.
- We used Market-1501 dataset to train the model and used our self-made dataset UESTC Re-ID Dataset, and Market-1501 to test the model.
- The model is base on ResNet-50 and TriHard Loss.

## INTERNSHIP

---

**Embedded System Engineer** Mar. 2021 - May. 2021  
Tsinghua University Sichuan Energy Internet Research Institute *Chengdu, China*

- Mainly engaged in STM32 development and related PCB design.
